

Brainstorming and ideation prioritization

DATE	29 September 2026
TEAM ID	SWTID-2026-1812
PROJECT NAME	Comic craft-Ai comic story creator using gemini models
MAXIMUM MARKS	3 Marks

1. Introduction

Brainstorming is the initial stage of the project development process where team members discuss different ideas, identify possible problems, and explore suitable technology-based solutions. The main purpose of brainstorming is to generate multiple project ideas before selecting the most suitable one.

Our team conducted a brainstorming session to identify an innovative project that could make use of Artificial Intelligence and Generative AI. We focused on ideas that could be useful to students, beginners, content creators, and general users.

The team discussed different application ideas and evaluated them based on usefulness, feasibility, innovation, technical requirements, and expected user benefits.

2. Objectives of Brainstorming

The main objectives of the brainstorming session were:

- To generate multiple innovative project ideas.
- To identify real-world problems that can be solved using AI.
- To understand the needs of potential users.
- To identify suitable Generative AI technologies.
- To compare different project ideas.
- To select a project that can be implemented within the available time and resources.

- To develop a project that demonstrates practical use of AI.
- To select an idea that provides a useful and creative user experience.

3. Ideas Discussed by the Team

During the brainstorming process, several project ideas were considered.

3.1 AI Story Generator

The first idea was an AI Story Generator that could create stories from user-provided topics or keywords. The system could generate characters, events and story endings automatically.

3.2 AI Comic Creator

The second idea was an AI-powered comic creation application. Users could provide a simple story idea, character name, setting, tone and art style. The system would then generate a structured comic story with narration, dialogue and images.

3.3 AI Study Assistant

Another idea was an AI Study Assistant that could help students understand educational topics, generate summaries and answer questions.

3.4 AI Image Generator

The team also considered developing an AI image generation application where users could enter text prompts and receive AI-generated images.

3.5 AI Resume Builder

An AI Resume Builder was another idea considered. The application could help users create structured resumes based on their educational qualifications and skills.

4. Idea Evaluation

The ideas were evaluated using several criteria.

Feasibility

The team considered whether the project could be developed using available technologies and resources.

Innovation

The uniqueness and creative use of Artificial Intelligence were considered.

Usefulness

The team considered whether the project could solve a practical user problem.

Technical Implementation

The availability of suitable frameworks, APIs and AI models was considered.

User Experience

The project needed to provide a simple and understandable interface.

5. Idea Prioritization

Project Idea	Feasibility	Innovation	Usefulness	AI Usage	Priority
AI Story Generator	High	Medium	High	High	High
AI Comic Creator	High	High	High	High	Highest
AI Study Assistant	Medium	Medium	High	High	High
AI Image Generator	Medium	High	Medium	High	Medium
AI Resume Builder	High	Medium	High	Medium	Medium

Based on the evaluation, the AI Comic Creator received high priority because it combines storytelling, image generation and Generative AI in one application.

6. Selected Project Idea

The final project selected by the team was:

ComicCraft – AI Comic Story Creator using Gemini Models

ComicCraft is a web-based AI application designed to help users create short comics from simple story ideas.

The user can provide:

- Story prompt
- Main character name
- Setting
- Tone
- Art style

The application processes these inputs using AI and generates a structured comic experience.

7. Why ComicCraft Was Selected

Comic creation normally requires multiple skills such as drawing, character design, storytelling, panel arrangement and dialogue writing. Beginners may have creative ideas but may not have the technical or artistic skills required to convert those ideas into a complete comic.

ComicCraft attempts to simplify this process by using Generative AI.

The project was selected because:

- It provides a creative application of AI.
- It combines text and image generation.
- It reduces the effort required to create a comic.
- It can be used by beginners.
- It demonstrates practical Generative AI usage.
- It provides an interactive user experience.
- It can generate a complete comic workflow from input to output.

8. Project Vision

The vision of ComicCraft is to make comic creation easier and more accessible to users who have creative ideas but limited drawing or designing skills.

The application aims to transform a simple story concept into a structured comic containing story panels, narration, dialogue and visual content.

9. Expected Benefits

The expected benefits include:

1. Reduced comic creation time.
2. Easy story development.
3. AI-assisted narration and dialogue.
4. AI-generated visual content.
5. Beginner-friendly comic creation.
6. Improved creative experimentation.
7. Easy preview and export of generated comics.

10. Conclusion

The brainstorming and idea prioritization process helped the team compare different project possibilities and select a suitable idea. After evaluating feasibility, innovation, usefulness and AI integration, ComicCraft was selected as the project.

ComicCraft demonstrates how Generative AI can be applied to creative content generation and provides a simple workflow for users to transform their ideas into comics.
